# YOUR SERVERS RUN YOUR WORK, WHO RUNS YOUR SERVERS?

# With Great Infrastructure comes great complexity

**Single-server Tools** — Easy, but limited.

**Kubernetes** — Powerful, but complicated.

**Cloud Dashboards** — Convenient, but dependent.

**Monitoring Tools** — Show the problems, don’t solve.

**Enterprise Systems** — Capable, but heavy and expensive

# Owning Hardware Is Easy, Running It is Painful

Which GPU is free?

What's about to fail?

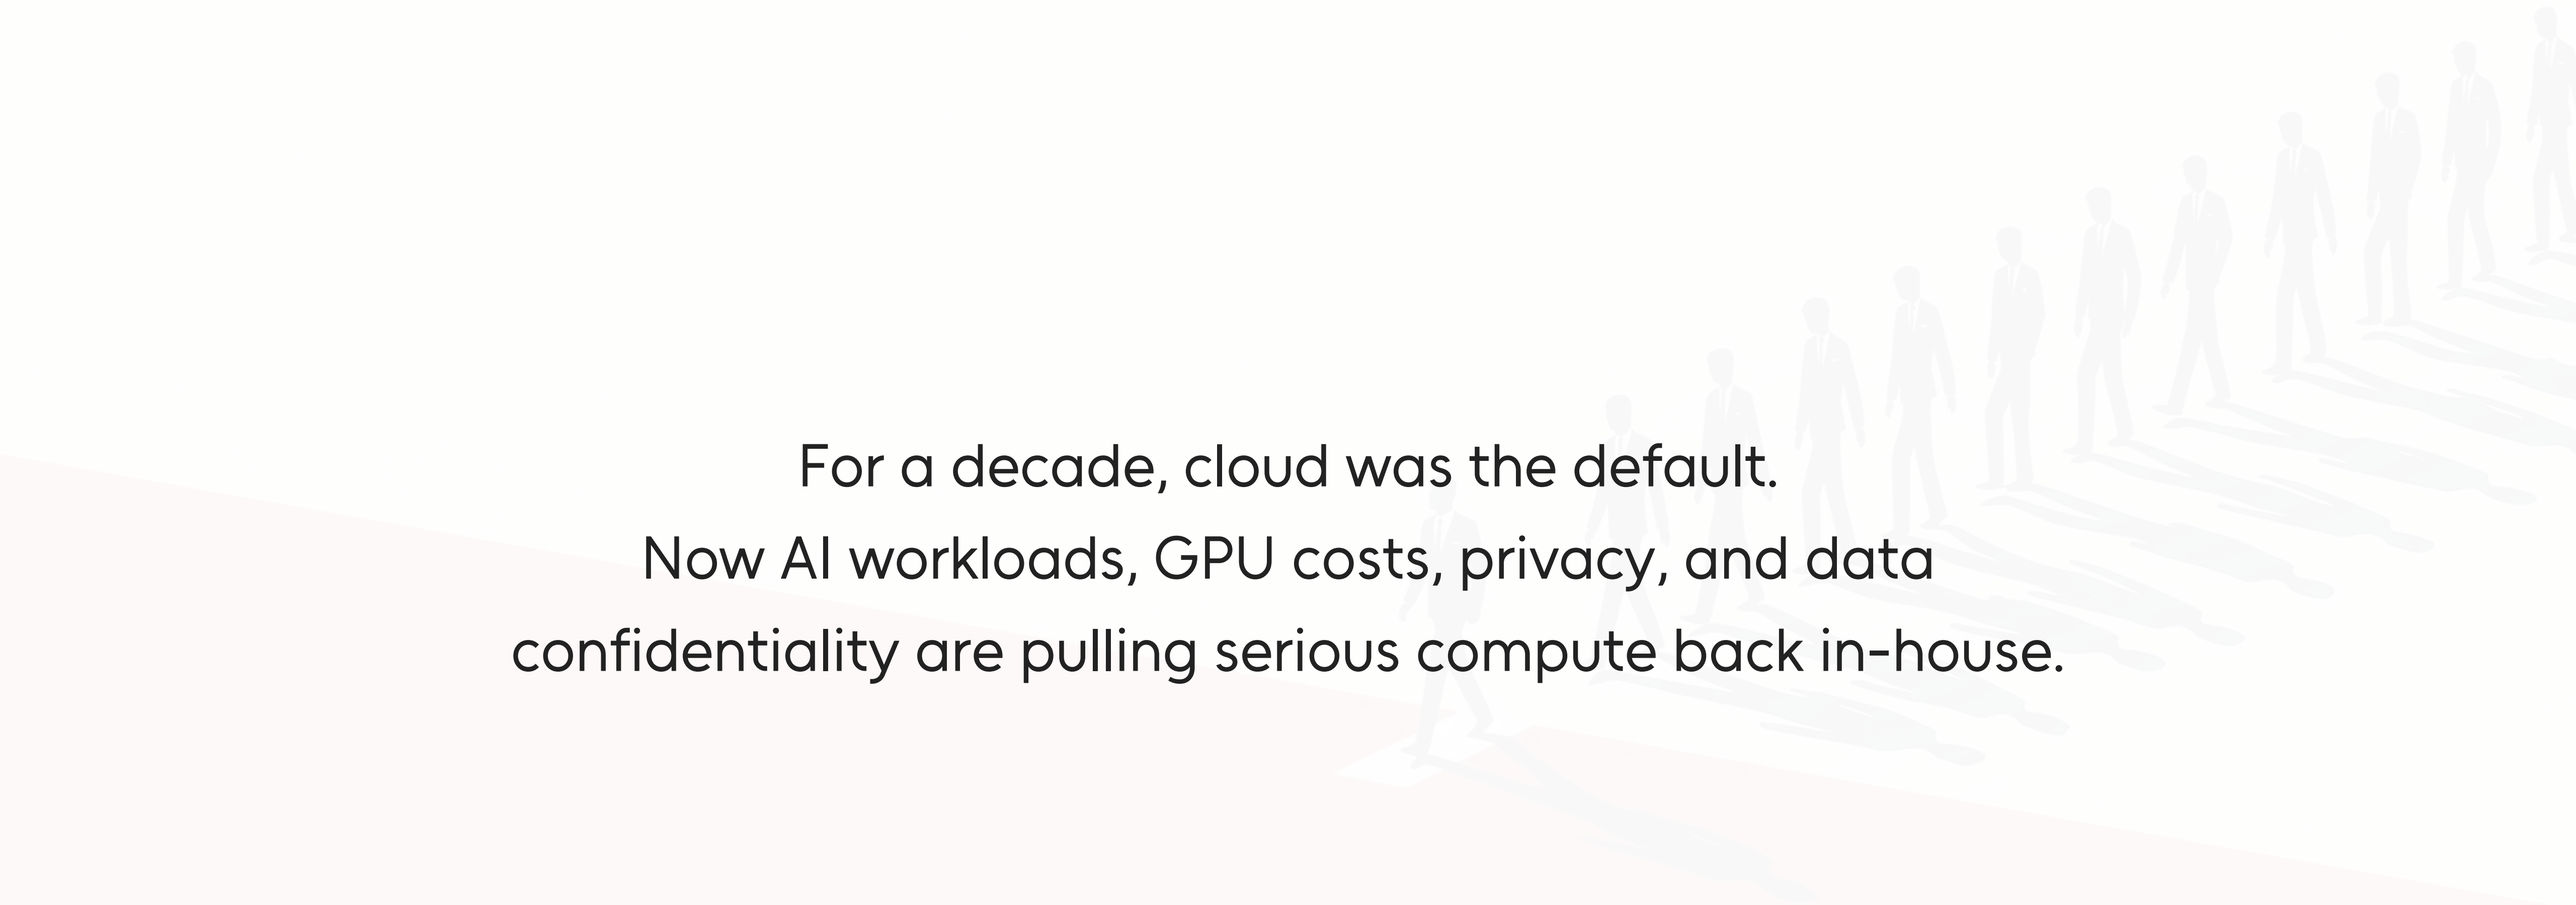

Which server is overloaded?

How much storage is left?

Which machine is overheating?

Where is each workload running?

# The Hardware Is Coming Home

For a decade, cloud was the default.
Now AI workloads, GPU costs, privacy, and data confidentiality are pulling serious compute back in-house.

# The Future Is Owned, Private & Hybrid

**79%** of enterprises have already moved at least one AI workload back from public cloud.

**73%** Plan further shifts toward on premises or hybrid infrastructure over the next two years.

# RackOps

Solving For Servers

# See. Connect. Run.

**Node Agent** : Reads the hardware on every machine.

**Private Mesh** : Links machines securely across racks and locations.

**Control Plane** : Shows the fleet and decides where work should go.

# Inside The Box

RackOps inspects every machine, places work where it runs best, & helps prevent failures before they happen.

| | | |
|---|---|---|
| CPU | GPU | NPU |
| Storage | RackOps | Network |
| Power | Thermal | Workloads |

# Inside The Box

| | | |
|---|---|---|
| CPU | GPU | NPU |
| Storage | **RackOps** | Network |
| Power | Thermal | Workloads |

***RackOps*** *inspects every machine, places work where it runs best, & helps prevent failures before they happen.*

# The Differentiator

Other tools check *whether* the app is running.
**RackOps** decides *where* it should run matching each workload to the machine that runs it best.

Kubernetes is powerful, but it needs specialists.
**RackOps** is built for teams that need infrastructure control without building an infrastructure team.

# Who Needs It Most Today

AI builders and GPU labs

Startups with their own servers

Government and regulated organisations

Managed service providers

Private cloud teams

Edge operators

# Running Real Workloads

**Better Roads** — Civic-tech infrastructure and application workloads.

**EmiiCo** — Creator-tech platform workloads and deployment needs.

**Darshi** — Civic-tech experiments and infrastructure support.

**RogX**—Early infrastructure and workload management use cases.

# A $75B Market Moving Back On-premise

**TAM** — *$75.4B* growing to ~*$498B* by 2034 at *26.6%* CAGR.

**SAM** — Teams running their own server and GPU fleets: cloud/hybrid orchestration.

**SOM** — *~$54M reachable*
Bottom-up: ~3,000 target teams × ~$18K/year (20 nodes × $75/node/mo).

# How We Make Money

**Per Machine, Monthly** — Small and mid-size teams pay for each machine. Free for the first 3, then $50–100 per machine per month.

**Big Annual Contracts** — enterprises and private GPU clusters pay a yearly subscription, with support and private deployment.

**Later - Marketplace** — As the network grows, a premium on smart workload scheduling across racks. We charge for the software.

# How We Make Money
